EEBUS-Hub now supports the EEBUS LPC (Limitation of Power Consumption) use case in both server and client modes! This enhancement ensures that your device's **§ 14a** compliance is achieved faster and more efficiently, accelerating interoperability testing and enabling the development of diverse and complex scenarios. Additionally, EEBUS-Hub allows you to seamlessly integrate test scenarios into CI/CD environments.

# Use Case Demo Setup

# Description

Simulate sending EEBUS LPC command using EEBUS-Hub energy guard and visualize the response of the controllable system (DUT)

The controllable system in this demo is a **3-phase wallbox charger** with the following current limitations:

- Minimum: **6A** per phase (**4,140 W** on all phases)
- Maximum: **16A** per phase (**11,040 W** on all phases)

**1**

Less Than  
**4140 W**

Apply power limit less than **4140 W** and observe the Wallbox's reaction

**Example One**

**2**

**4140w -  
11000w**

Apply power limits within the allowed limits and observe the Controllable Device Reaction

**Example Two**

**3**

Higher Than  
**11040 W**

Apply power limits higher than **11040 W** and observe the the Controllable Device Reaction

**Example Three**

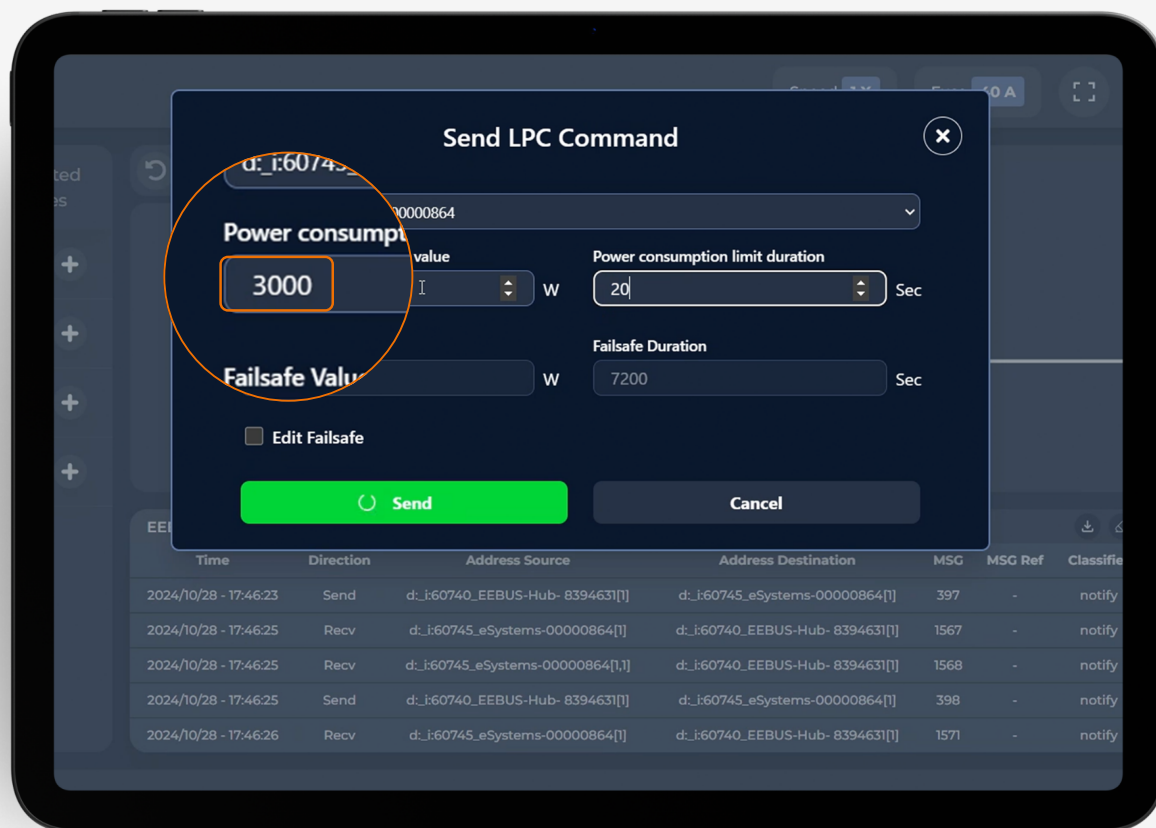

# Demo

# Demo Steps In Details

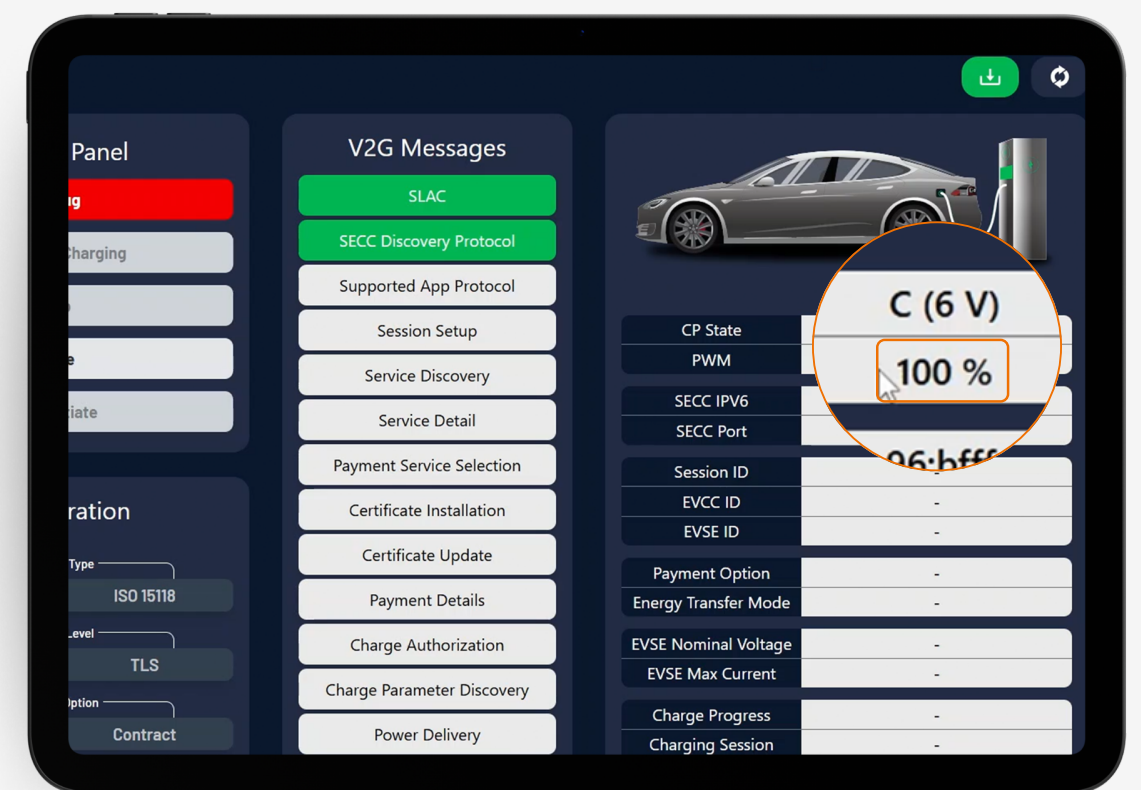

# Setting Power Limit and Interval (Example 1)

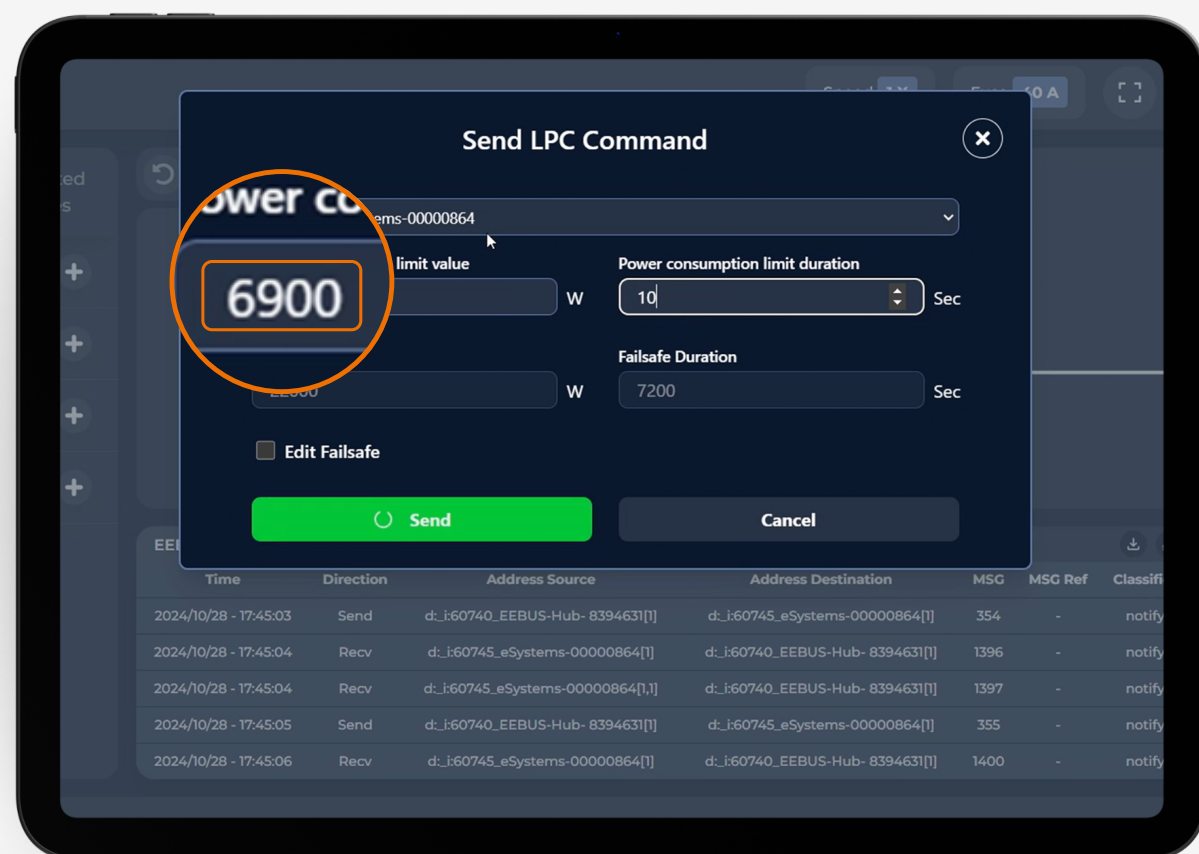

Apply power limit **3000** W for **20** sec **4.34** A per phase

EV-Simulator displays PWM of **100%**, which indicates the interruption of the charging for **20** sec as requested by the LPC command.

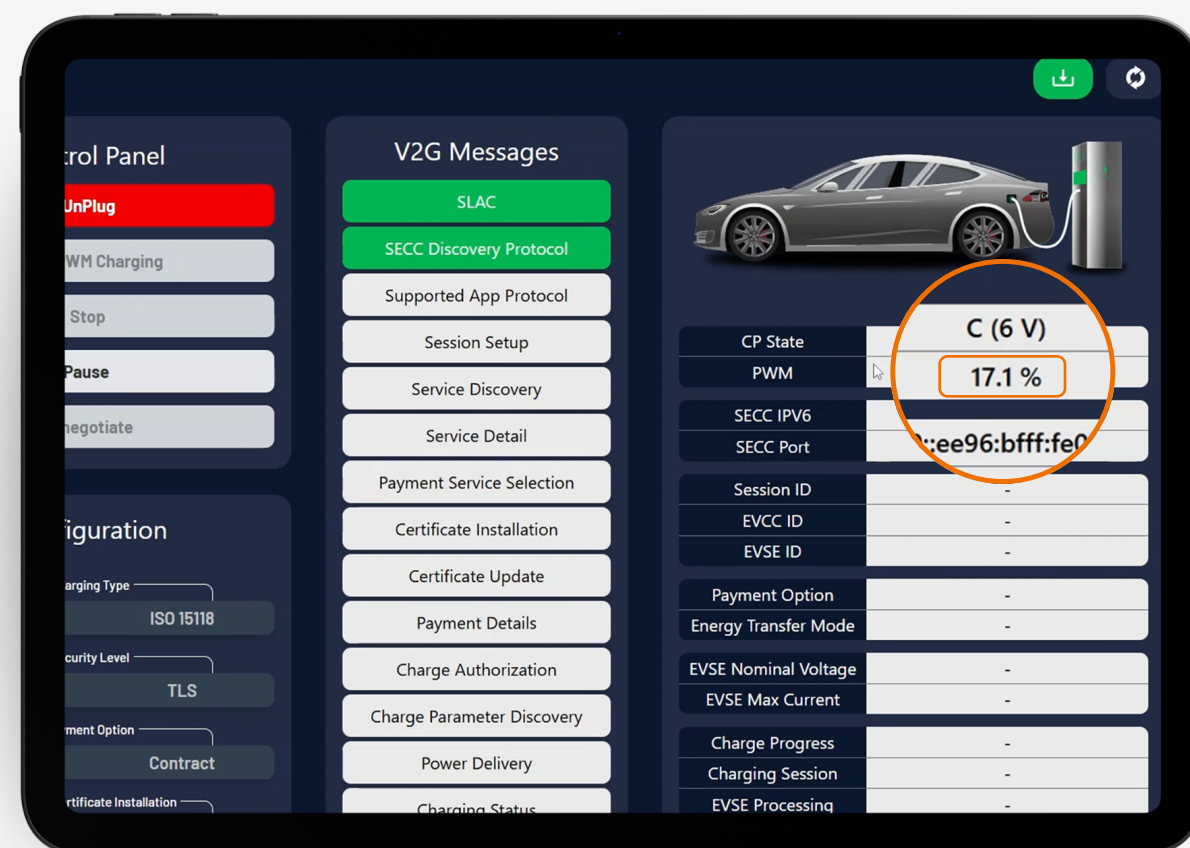

# Setting Power Limit and Interval (Example 2)

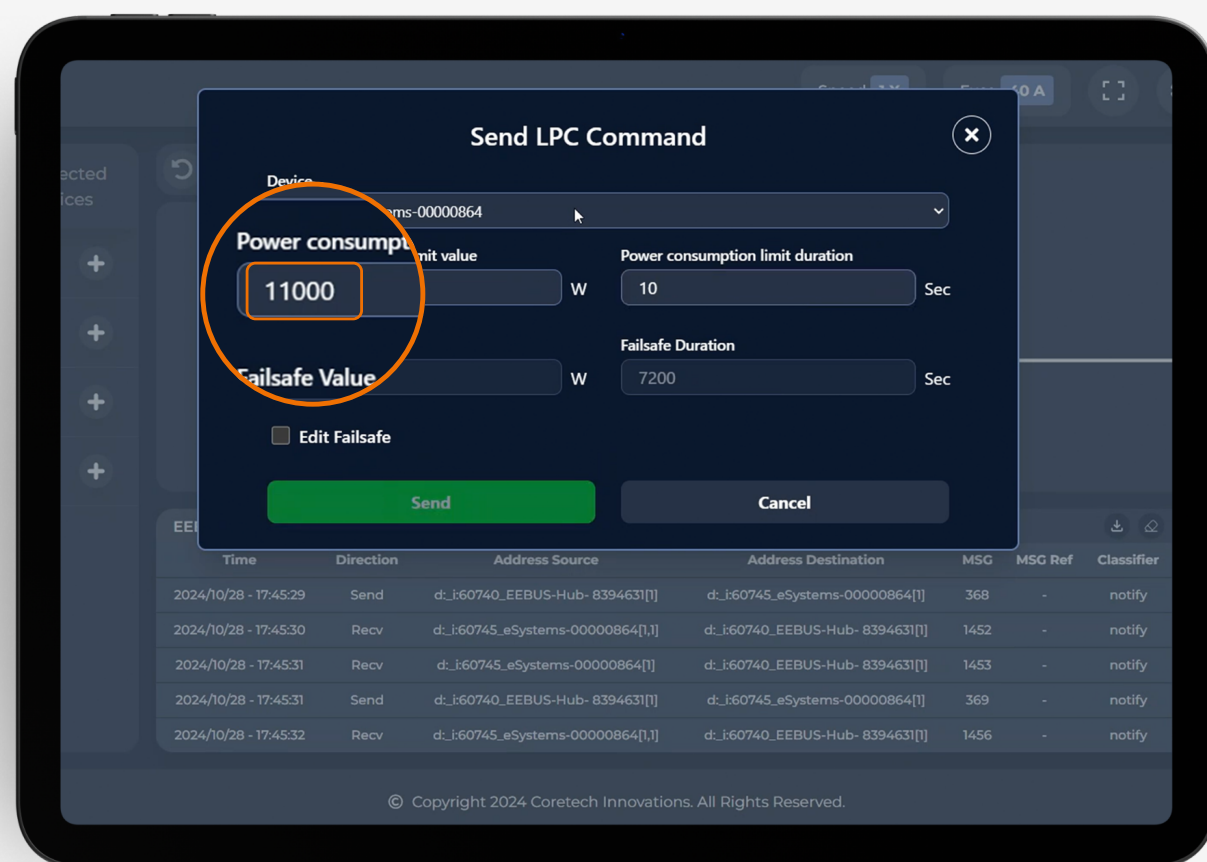

Apply power limit **6900 W**  
for **10 sec 10A** per phase

EV-Simulator displays PWM of **17.1%**,  
which indicates the reduction of  
charging power for **10 sec**

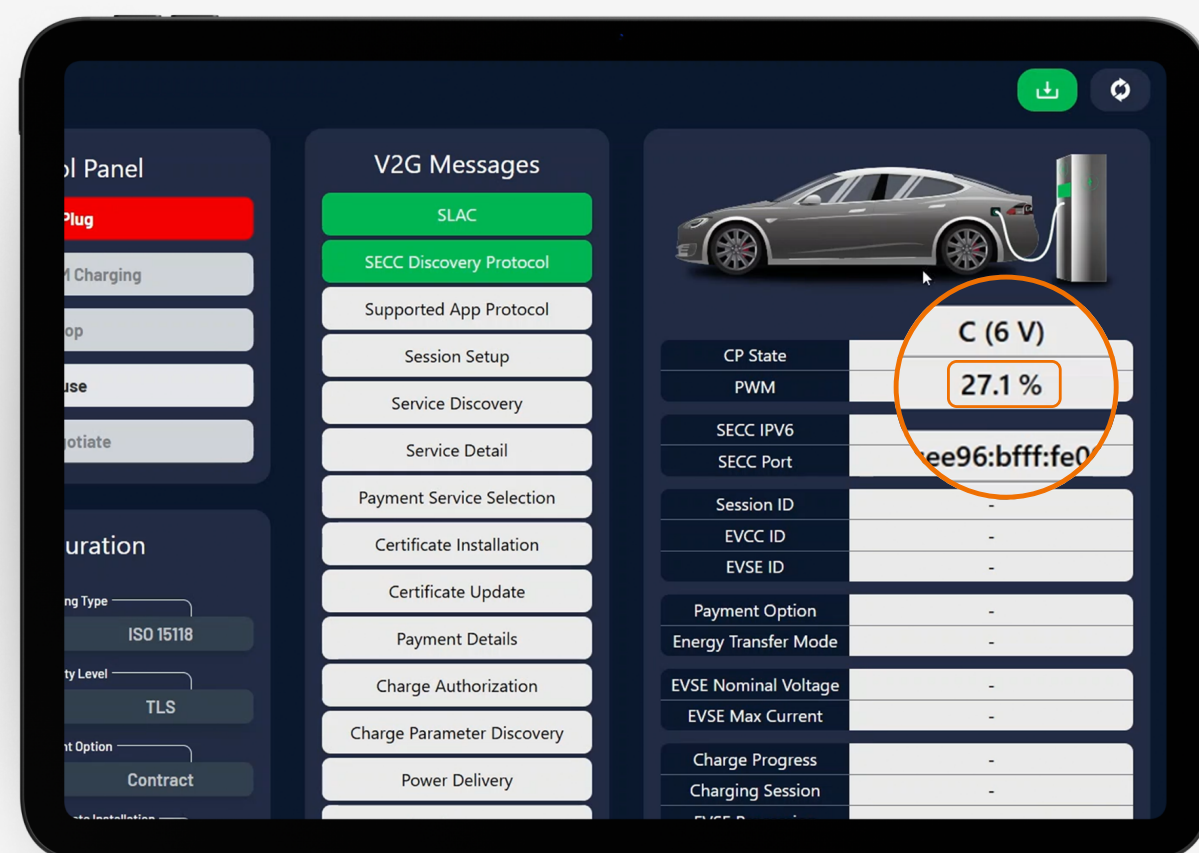

# Setting Power Limit and Interval (Example 3)

Apply power limit **15000** W for **10** sec **21.73** A per phase

EV-Simulator displays PWM of **27.1%**, which indicates the EV-Sim is charging with almost the maximum power for **10** sec
